

## CS1306 - MACHINE LEARNING - WEEK 3

Question 1:

For a given set of training data examples stored in a .CSV file, implement and demonstrate the Candidate-Elimination algorithm to output a description of the set of all hypotheses consistent with the training examples.

**CANDIDATE- ELIMINTION algorithm using version spaces Training Examples:**

Example	Sky	AirTemp	Humidity	Wind	Water	Forecast	EnjoySport
1	Sunny	Warm	Normal	Strong	Warm	Same	Yes
2	Sunny	Warm	High	Strong	Warm	Same	Yes
3	Rainy	Cold	High	Strong	Warm	Change	No
4	Sunny	Warm	High	Strong	Cool	Change	Yes

Question 2:

For a given set of training data examples stored in a .CSV file, implement and demonstrate the Find-S algorithm

Example	Size	Color	Shape	Class/Label
1	Big	Red	Circle	No
2	Small	Red	Triangle	No
3	Small	Red	Circle	Yes
4	Big	Blue	Circle	No
5	Small	Blue	Circle	Yes

Question 3:

Implement Candidate Elimination and Find S algorithm and find the difference between the hypotheses generated.

**Step 1:**

<i>example</i>	<i>citations</i>	<i>size</i>	<i>inLibrary</i>	<i>price</i>	<i>editions</i>	<i>buy</i>
1	some	small	no	affordable	many	no
2	many	big	no	expensive	one	yes
3	some	big	always	expensive	few	no
4	many	medium	no	expensive	many	yes
5	many	small	no	affordable	many	yes

**CANDIDATE-ELIMINATION Learning Algorithm**

The CANDIDATE-ELIMINATION algorithm computes the version space containing all hypotheses from H that are consistent with an observed sequence of training examples.

1. Initialize G to the set of maximally general hypotheses in H
2. Initialize S to the set of maximally specific hypotheses in H
3. For each training example d, do
  - If d is a positive example
    - Remove from G any hypothesis inconsistent with d
    - For each hypothesis s in S that is not consistent with d
      - Remove s from S
      - Add to S all minimal generalizations h of s such that
        - h is consistent with d, and some member of G is more general than h
    - Remove from S any hypothesis that is more general than another hypothesis in S
  - If d is a negative example
    - Remove from S any hypothesis inconsistent with d
    - For each hypothesis g in G that is not consistent with d
      - Remove g from G

- Add to G all minimal specializations h of g such that
  - h is consistent with d, and some member of S is more specific than h
- Remove from G any hypothesis that is less general than another hypothesis in G

**Algorithmic steps:**

**Initially :** G = [[ '?', '?', '?', '?', '?', '?' ], [ '?', '?', '?', '?', '?', '?' ], [ '?', '?', '?', '?', '?', '?' ],  
 [ '?', '?', '?', '?', '?', '?' ], [ '?', '?', '?', '?', '?', '?' ], [ '?', '?', '?', '?', '?', '?' ]]  
 S = [ Null, Null, Null, Null, Null, Null ]

**For instance 1 :** <'sunny','warm','normal','strong','warm ','same'> and positive output.  
 G1 = G  
 S1 = ['sunny','warm','normal','strong','warm ','same']

**For instance 2 :** <'sunny','warm','high','strong','warm ','same'> and positive output.  
 G2 = G  
 S2 = ['sunny','warm','?','strong','warm ','same']

**For instance 3 :** <'rainy','cold','high','strong','warm ','change'> and negative output.  
 G3 = [['sunny', '?', '?', '?', '?', '?' ], [ '?', 'warm', '?', '?', '?', '?' ], [ '?', '?', '?', '?', '?', '?' ],  
 [ '?', '?', '?', '?', '?', '?' ], [ '?', '?', '?', '?', '?', '?' ], [ '?', '?', '?', '?', '?', 'same' ]]  
 S3 = S2

**For instance 4 :** <'sunny','warm','high','strong','cool','change'> and positive output.  
 G4 = G3  
 S4 = ['sunny','warm','?','strong', '?', '?']

At last, by synchronizing the G4 and S4 algorithm produce the output.  
 G = [['sunny', '?', '?', '?', '?', '?' ], [ '?', 'warm', '?', '?', '?', '?' ]]  
 S = ['sunny','warm','?','strong', '?', '?']

**Instruction:**

The training examples should be saved in csv file format. [Enjoysport.csv](#) and save in the same folder where this python file is saved .
